

a projector for projecting a pattern light on the region; and  
a monitor for displaying the image of the object, the monitor having a memory for storing the image of the object that the image capturing device captures when the projector does not project the pattern light on the region,

wherein the image capturing device captures a projection pattern formed on the object by the pattern light, and

wherein, when the projector projects the pattern light on the region, the monitor displays the image of the object stored in the memory instead of the image of the object the image capturing device captures with the projector projecting the pattern light on the region.

2. (Amended) The camera as claimed in claim 1, wherein the pattern light is a non-uniform light and has a distribution of illuminance, and

the projection pattern which is formed on the object within the region by the pattern light comprises at least one stripe.

3. (Amended) The camera as claimed in claim 1, wherein the pattern light comprises a colored light, and

the projection pattern that is formed on the object within the region by the pattern light comprises a colored part.

4. (Amended) A camera capable of getting information about a three-dimensional shape of an object, comprising:

a projector for projecting a light having a predetermined pattern on the object;  
a photographing part for photographing the object;  
a memory for storing an image of the object that the photographing part photographs in a state in which the projector does not project the light having the predetermined pattern on the object; and

A1  
C1  
C2  
C3  
a display part for displaying the image of the object stored in the memory instead of the image of the object the photographing part photographs while the projector projects the light having the predetermined pattern on the object.

A2  
C1  
C2  
C3  
6. (Amended) The camera as claimed in claim 4, wherein the light having the predetermined pattern is a non-uniform light and has a distribution of illuminance, and a projection pattern that is formed on the object by the light having the predetermined pattern comprises at least one stripe.

7. (Amended) The camera as claimed in claim 4, wherein the light having the predetermined pattern comprises a colored light, and a projection pattern that is formed on the object by the light having the predetermined pattern comprises a colored part.

Sub C3  
8. (Amended) A camera capable of getting information about a three-dimensional shape of an object, comprising:

an image taking part for successively taking images of the object;  
a first memory for successively and temporarily storing the images of the object the image taking part takes;  
a display part for renewing and displaying the images of the object successively; and  
a projector for projecting a light with a predetermined pattern on the object,  
wherein the display part displays the image of the object stored in the first memory prior to a projection of the light with the predetermined pattern by the projector instead of the image of the object the image taking part takes when the image taking part takes the image of the object in a state in which the projector projects the light with the predetermined pattern.

9. (Amended) The camera as claimed in claim 8, further comprising a second memory for storing the images of the object the image taking part takes, the second memory outputting the stored images of the object to the first memory successively.

az  
concl

10. (Amended) The camera as claimed in claim 9, wherein the second memory stores the image of the object the image taking part takes, and the image of the object stored in the second memory is prohibited from being outputted to the first memory when the image taking part takes the image of the object in the state in which the projector projects the light with the predetermined pattern.

11. (Amended) The camera as claimed in claim 8, wherein the display part is prohibited from renewing the image of the object when the image taking part takes the image of the object in the state in which the projector projects the light with the predetermined pattern.

12. (Amended) The camera as claimed in claim 8, wherein the light with the predetermined pattern is a non-uniform light and has a distribution of illuminance, and a projection pattern that is formed on the object by the light with the predetermined pattern comprises at least one stripe.

13. (Amended) The camera as claimed in claim 8, wherein the light with the predetermined pattern comprises a colored light, and a projection pattern that is formed on the object by the light with the predetermined pattern comprises a colored part.
